
✅ 1. What is Software?

Explanation:

Software is a collection of computer programs that perform specific tasks. It enables hardware to function and provides services to users.

Types of Software:

- **System Software:** Operating systems, device drivers (e.g., Windows, Linux).
- **Programming Software:** Compilers, debuggers, interpreters.
- **Application Software:** Web apps (Amazon, LinkedIn), mobile apps, desktop apps (MS Word, Excel).

Interview Importance: High – often asked in fundamentals.

Question Variations:

- Define software and its types.
- Differentiate between system, application, and programming software.
- Give examples of application software.

✅ 2. What is Software Testing?

Explanation:

Software Testing is the process of evaluating a software application to ensure it meets customer requirements and is free of defects. It is a critical phase before delivery.

Key Points:

- Detect defects early.
- Ensure quality product delivery.
- Validate against customer requirements.

Interview Importance: Very High – core concept.

Question Variations:

- What is software testing and why is it important?
 - Explain the role of testing in SDLC.
 - How does testing improve software quality?
-

✅ 3. What is Software Quality?

Explanation:

Software quality means delivering a product that meets certain parameters:

- Bug-free
- Delivered on time
- Within budget
- Meets requirements
- Maintainable and user-friendly

Interview Importance: Frequently asked in QA roles.

Question Variations:

- Define software quality and its parameters.
 - How do you measure software quality?
 - Why is maintainability important?
-

✅ 4. Project vs Product

Explanation:

- **Project:** Developed for a specific customer requirement.
- **Product:** Developed for market needs, used by multiple customers.

Interview Importance: Common in service vs product-based company discussions.

Question Variations:

- Differentiate between project and product.
 - Give examples of each.
 - How does testing differ for projects vs products?
-

✅ 5. Why do we need Testing?

Explanation:

Testing ensures quality, prevents defects from reaching customers, and saves cost/time by detecting issues early.

Interview Importance: High – conceptual question.

Question Variations:

- Why is testing necessary?

- What happens if testing is skipped?
 - How does testing impact customer satisfaction?
-

✅ 6. Error, Bug & Failure

Explanation:

- **Error:** Human mistake during development.
- **Bug/Defect:** Issue in code identified during testing.
- **Failure:** When software behaves incorrectly in production.

Interview Importance: Frequently asked for clarity.

Question Variations:

- Differentiate between error, bug, and failure.
 - Give examples of each.
 - How do you handle bugs found in production?
-

✅ 7. Why Software Has Bugs?

Explanation:

- Miscommunication or no communication
- Software complexity
- Programming errors
- Changing requirements
- Lack of skilled testers

Interview Importance: Common in QA interviews.

Question Variations:

- Why do bugs occur in software?
- How can we minimize bugs?
- Which factor contributes most to defects?
